A real polynomial $P(X) = X^d + p_{d-1}X^{d-1} + \dots + p_0 \in \mathbb{R}[X]$ is called **contractive** iff all of its roots (real and complex) lie inside the unit disk.

A real polynomial $P(X) = X^d + p_{d-1}X^{d-1} + \dots + p_0 \in \mathbb{R}[X]$ is called **contractive** iff all of its roots (real and complex) lie inside the unit disk.

For $d \in \mathbb{N}$ let $\mathcal{E}_d \subseteq \mathbb{R}^d$ denote the set of all d -dimensional coefficient vectors of contractive polynomials (**Schur-Cohn region**)

A real polynomial $P(X) = X^d + p_{d-1}X^{d-1} + \dots + p_0 \in \mathbb{R}[X]$ is called **contractive** iff all of its roots (real and complex) lie inside the unit disk.

For $d \in \mathbb{N}$ let $\mathcal{E}_d \subseteq \mathbb{R}^d$ denote the set of all d -dimensional coefficient vectors of contractive polynomials (**Schur-Cohn region**)

For $r \in \mathbb{N}_0$ and $s \in \mathbb{N}_0$ with $d = r + 2s$ let $\mathcal{E}_d^{(s)} \subseteq \mathcal{E}_d$ denote the set of those coefficient vectors in \mathcal{E}_d the corresponding polynomials of which have exactly r real roots (and s pairs of complex conjugate roots).

A real polynomial $P(X) = X^d + p_{d-1}X^{d-1} + \dots + p_0 \in \mathbb{R}[X]$ is called **contractive** iff all of its roots (real and complex) lie inside the unit disk.

For $d \in \mathbb{N}$ let $\mathcal{E}_d \subseteq \mathbb{R}^d$ denote the set of all d -dimensional coefficient vectors of contractive polynomials (**Schur-Cohn region**)

For $r \in \mathbb{N}_0$ and $s \in \mathbb{N}_0$ with $d = r + 2s$ let $\mathcal{E}_d^{(s)} \subseteq \mathcal{E}_d$ denote the set of those coefficient vectors in \mathcal{E}_d the corresponding polynomials of which have exactly r real roots (and s pairs of complex conjugate roots).

Let $v_d := \lambda_d(\mathcal{E}_d)$ and $v_d^{(s)} := \lambda_d(\mathcal{E}_d^{(s)})$ where λ_d denotes the d -dimensional Lebesgue measure.

A real polynomial $P(X) = X^d + p_{d-1}X^{d-1} + \dots + p_0 \in \mathbb{R}[X]$ is called **contractive** iff all of its roots (real and complex) lie inside the unit disk.

For $d \in \mathbb{N}$ let $\mathcal{E}_d \subseteq \mathbb{R}^d$ denote the set of all d -dimensional coefficient vectors of contractive polynomials (**Schur-Cohn region**)

For $r \in \mathbb{N}_0$ and $s \in \mathbb{N}_0$ with $d = r + 2s$ let $\mathcal{E}_d^{(s)} \subseteq \mathcal{E}_d$ denote the set of those coefficient vectors in \mathcal{E}_d the corresponding polynomials of which have exactly r real roots (and s pairs of complex conjugate roots).

Let $v_d := \lambda_d(\mathcal{E}_d)$ and $v_d^{(s)} := \lambda_d(\mathcal{E}_d^{(s)})$ where λ_d denotes the d -dimensional Lebesgue measure.

Main interest: $v_d^{(s)}$ and $\frac{v_d^{(s)}}{v_d^{(0)}}$

Basic facts and previous results

- \mathcal{E}_d is the disjoint union of all $\mathcal{E}_d^{(s)}$, $0 \leq 2s \leq d$.

Basic facts and previous results

- \mathcal{E}_d is the disjoint union of all $\mathcal{E}_d^{(s)}$, $0 \leq 2s \leq d$.
- The boundary of \mathcal{E}_d is the union of finitely many algebraic surfaces.
(SCHUR 1918)

Basic facts and previous results

- \mathcal{E}_d is the disjoint union of all $\mathcal{E}_d^{(s)}$, $0 \leq 2s \leq d$.
- The boundary of \mathcal{E}_d is the union of finitely many algebraic surfaces. (SCHUR 1918)
- The boundary of \mathcal{E}_d is the union of two hyperplanes and one hypersurface. (FAM, MEDITCH 1978)

$\rho_d(x) = \sum_{k=0}^d \binom{d+k}{d-k} x^k$ (associated Legendre polynomial)

Since ρ_d satisfies the recursive formula

$$\rho_d(x) = (x + 2)\rho_{d-1}(x) - \rho_{d-2}(x)$$

$$\rho_0(x) = 0$$

$$\rho_1(x) = x + 1$$

we get $(-1)^d \rho_d(-4) = 2d + 1$

Since ρ_d satisfies the recursive formula

$$\rho_d(x) = (x+2)\rho_{d-1}(x) - \rho_{d-2}(x)$$

$$\rho_0(x) = 0$$

$$\rho_1(x) = x + 1$$

we get $(-1)^d \rho_d(-4) = 2d + 1$

Also $P_d(-x) = (-1)^d P_d(x)$

Since ρ_d satisfies the recursive formula

$$\rho_d(x) = (x+2)\rho_{d-1}(x) - \rho_{d-2}(x)$$

$$\rho_0(x) = 0$$

$$\rho_1(x) = x + 1$$

we get $(-1)^d \rho_d(-4) = 2d + 1$

Also $P_d(-x) = (-1)^d P_d(x)$

and therefore $\frac{v_d^{(1)}}{v_d^{(0)}} = \frac{P_d(3) - 2d - 1}{4}$

Since ρ_d satisfies the recursive formula

$$\rho_d(x) = (x+2)\rho_{d-1}(x) - \rho_{d-2}(x)$$

$$\rho_0(x) = 0$$

$$\rho_1(x) = x + 1$$

we get $(-1)^d \rho_d(-4) = 2d + 1$

Also $P_d(-x) = (-1)^d P_d(x)$

and therefore $\frac{\nu_d^{(1)}}{\nu_d^{(0)}} = \frac{P_d(3)-2d-1}{4}$

Since P_d satisfies the recursive formula

$$dP_d(x) = (2d-1)xP_{d-1}(x) - (d-1)P_{d-2}(x)$$

$$P_0(x) = 1, P_1(x) = x$$

we get that

$$(d+1) \frac{\nu_d^{(1)}}{\nu_d^{(0)}} = 3(2d-1) \frac{\nu_{d-1}^{(1)}}{\nu_{d-1}^{(0)}} - d \frac{\nu_{d-2}^{(1)}}{\nu_{d-2}^{(0)}} + 2d(d+1)$$

$$\frac{\nu_0^{(1)}}{\nu_0^{(0)}} = 0, \frac{\nu_1^{(1)}}{\nu_1^{(0)}} = 0$$
