Create types by 2 rules (set of types: $\mathbb{T}$)
- var.: $\alpha, \beta, \gamma, \delta, \ldots$ (set of variables: $\mathbb{V}$)
- arr.: S, T in $\mathbb{T}$ $\Rightarrow$ $(S \to T)$ in $\mathbb{T}$

$\mathbb{T} = \mathbb{V} \mid (\mathbb{T} \to \mathbb{T})$

Notation (again guided by Currying of multivariate functions)
- drop outermost parenthesis: $\alpha \to \beta = \alpha \to \beta$
- arr. right associative: $\alpha \to \beta \to \gamma = (\alpha \to (\beta \to \gamma))$

Statement, declaration, context, judgement
- a statement is of the form: $M : T$ where M in Λ and T in $\mathbb{T}$
  read: M is of type T
- a declaration is a statement $X : T$ where X in V
- a context is a list $X_1 : T_1, \ldots, X_n : T_n$ of declarations
- a judgement is of the form $\Gamma \vdash M : T$ where Γ is a context
  read: in the context Γ, M is of type T

Derivation rules (for valid judgements)
- var.: $\Gamma \vdash X : T$ if
  $X : T$ is declared in Γ
- app.: $\Gamma \vdash MN : T$ if
  $\Gamma \vdash M : S \to T$ and
  $\Gamma \vdash N : S$
- abs.: $\Gamma \vdash \lambda X : S.M : S \to T$ if
  $\Gamma, X : S \vdash M : T$

Flag format for derivations
- open nested flags for every declaration in context
- flag contains declaration
- flagpole indicates scope of declaration

Notation (again guided by Currying of multivariate functions)
- drop outermost parenthesis: $\alpha \to \beta = \alpha \to \beta$
- arr. right associative: $\alpha \to \beta \to \gamma = (\alpha \to (\beta \to \gamma))$

Statement, declaration, context, judgement
- a statement is of the form: $M : T$ where M in Λ and T in $\mathbb{T}$
  read: M is of type T
- a declaration is a statement $X : T$ where X in V
- a context is a list $X_1 : T_1, \ldots, X_n : T_n$ of declarations
- a judgement is of the form $\Gamma \vdash M : T$ where Γ is a context
  read: in the context Γ, M is of type T

Derivation rules (for valid judgements)
- var.: $\Gamma \vdash X : T$ if
  $X : T$ is declared in Γ
- app.: $\Gamma \vdash MN : T$ if
  $\Gamma \vdash M : S \to T$ and
  $\Gamma \vdash N : S$
- abs.: $\Gamma \vdash \lambda X : S.M : S \to T$ if
  $\Gamma, X : S \vdash M : T$

Flag format for derivations
- open nested flags for every declaration in context
- flag contains declaration
- flagpole indicates scope of declaration

A crash course in type theory

Create types by 2 rules (set of types: $\mathbb{T}$)
- var.: $\alpha, \beta, \gamma, \delta, \ldots$ (set of variables: $\mathbb{V}$)
- arr.: S, T in $\mathbb{T}$ $\Rightarrow$ $(S \to T)$ in $\mathbb{T}$

$\mathbb{T} = \mathbb{V} \mid (\mathbb{T} \to \mathbb{T})$

Notation (again guided by Currying of multivariate functions)
- drop outermost parenthesis: $\alpha \to \beta = \alpha \to \beta$
- arr. right associative: $\alpha \to \beta \to \gamma = (\alpha \to (\beta \to \gamma))$

Statement, declaration, context, judgement
- a statement is of the form: $M : T$ where M in Λ and T in $\mathbb{T}$
  read: M is of type T
- a declaration is a statement $X : T$ where X in V
- a context is a list $X_1 : T_1, \ldots, X_n : T_n$ of declarations

William Alvin Howard
(1926)

A richer type theory: the Calculus of Constructions

(sort) $\quad () \vdash * : \square$ — two rules in one: $s = *$ or $s = \square$

(silent) (var) $\quad \dfrac{\Gamma \vdash A : s}{\Gamma, X:A \vdash X:A}$ if $X \notin \mathrm{dom}(\Gamma)$

(silent) (weak) $\quad \dfrac{\Gamma \vdash A : B \quad \Gamma \vdash C : s}{\Gamma, X:C \vdash A : B}$ if $X \notin \mathrm{dom}(\Gamma)$

(silent) (form) $\quad \dfrac{\Gamma \vdash A : s_1 \quad \Gamma, X:A \vdash B : s_2}{\Gamma \vdash \Pi X:A.B : s_2}$ — four rules in one

$\leftarrow = A \to B$ if $X \notin FV(B)$

(app) $\quad \dfrac{\Gamma \vdash A : \Pi X:S.T \quad \Gamma \vdash B : S}{\Gamma \vdash AB : T[X:=B]}$ (silent)

(abst) $\quad \dfrac{\Gamma, X:S \vdash A : T \quad \Gamma \vdash \Pi X:S.T : s}{\Gamma \vdash \lambda X:S.A : \Pi X:S.T}$

(conv) $\quad \dfrac{\Gamma \vdash A : B \quad \Gamma \vdash B' : s}{\Gamma \vdash A : B'}$ if $B =_\beta B'$ (silent)

A richer type theory: the Calculus of Constructions

(1) **Sets** $S : *$.

(2) **Propositions** $P : *$.

(3) **Predicates** $P : S \to *$.

(4) **Implication** $A \Rightarrow B = A \to B$ $(= \Pi x : A.B$ *if* $x \notin FV(B))$.

(5) **Universal q.** $\forall x \in S : P(x) = \Pi x : S.Px$.

(6) **Absurdity** $\bot \equiv \Pi C : *.C$.

(7) **Negation** $\neg \equiv \Pi A : *.A \to \bot$.

(8) **Conjunction** $\wedge \equiv \Pi A : *.\Pi B : *.\Pi C : *.(A \to B \to C) \to C$, $A \wedge B = \wedge AB$.

(9) **Disjunction** $\vee \equiv \Pi A : *.\Pi B : *.\Pi C : *.(A \to C) \to (B \to C) \to C$, $A \vee B = \vee AB$.

(10) **Existential q.** $\exists \equiv \Pi S : *.\Pi P : S \to *.\Pi C : *.((\Pi x : S.(Px \to C)) \to C)$,

$\exists x \in S : P(x) = \exists SP$.

(11) **Axioms** *Add assumption in front of context.*

A richer type theory: the Calculus of Constructions

$(A \vee B) \Rightarrow (\neg A \Rightarrow B)$

$\lambda C : (\Pi C : *.\, (A \to C) \to (B \to C) \to C) \to (A \to \bot) \to B.$

(a) $A : *$

(b) $B : *$

(c) $x : \Pi C : *.\, (A \to C) \to (B \to C) \to C$

(d) $y : A \to \bot$

(1) $xB : (A \to B) \to (B \to B) \to B$ (app) on (c),(b)

(e) $u : A$

(2) $yu : \bot$ (app) on (d),(e)

(3) $yuB : B$ (app) on (2),(b)

(4) $\lambda u : A.\, yuB : A \to B$ (abst) on (3)

(5) $xB(\lambda u : A.\, yuB) : (B \to B) \to B$ (app) on (1),(4)

(f) $v : B$

(6) $v : B$ (var) on (f)

(7) $\lambda v : B.\, v : B \to B$ (abst) on (6)

(8) $xB(\lambda u : A.\, yuB)(\lambda v : B.\, v) : B$ (app) on (5),(7)

(9) $\lambda y : A \to \bot.\, xB(\lambda u : A.\, yuB)(\lambda v : B.\, v) : (A \to \bot) \to B$ (abst) on (8)

(10) $\lambda x : (\Pi C : *.\, (A \to C) \to (B \to C) \to C).\ \lambda y : A \to \bot.\, xB(\lambda u : A.\, yuB)(\lambda v : B.\, v) : (\Pi C : *.\, (A \to C) \to (B \to C) \to C) \to (A \to \bot) \to B$ (abst) on (9)

15 ## Overview
16
17 This file implements the p-adic integers `Zs[p]`, where p : ℕ (not necessarily prime and not
18 necessarily greater than 1), as a sequence d : ℕ → zmod p of digits. The `s` in Zs[p] stands
19 for both "sequence" and "sub" and distinguishes the p-adic integers as defined here from the p-adic
20 integers Z_[p] in mathlib. In contrast to Z_[p], the entire theory established in this file
21 around Zs[p] is computable.
22
23 The main theorems proved in this file are
24
25 * Zs[p] is inhabited.
26
27 * Zs[p] forms a commutative ring
28
29 * If p is prime, Zs[p] is isomorphic to Z_[p] (proved in the separate file
30 padic_integers_isomorphism to avoid any non-computable theorems in this file).
31
32 * Zs[0] ≃ ℤ^ℕ.
33
34 * Zs[1] ≃ 0.
35
36 * Zs[p] is non-trivial iff p ≠ 1.
37
38 * Zs[p] is a subsingleton iff p = 1.
39
40 * There is an embedding rats[p] →+* Zs[p] of the p-adic rationals into the p-adic integers.
41
42 * The embedding of the p-adic rationals into the p-adic integers is injective if p ≠ 1.
43
44 * If p ≠ 1, the canonical embeddings of_nat, of_int, and of_rat of ℕ, ℤ, and ℚ into Zs[p] are
45 injective.
46
47 * The characteristic of Zs[p] is 0 iff p ≠ 1.
48
49 * Zs[p] is isomorphic to Zs[u] × Zs[v] if p = u * v and u and v are coprime.
Restart File
master*
Zeile 1, Spalte 1 Leerzeichen: 2 UTF-8 CRLF lean4
DEU 12:55

```
49  Zs[p] is isomorphic to Zs[u] × Zs[v] if p = u * v and u and v are coprime.
50
51  * Zs[p] is isomorphic to Zs[u] if u = p^k and p = 1 ∨ 0 < k.
52
53  * Zs[p] is isomorphic to Π i, Zs[getD l i 1] if l = prime_pow_decomp p, the prime power
54  decomposition of p.
55
56  * d * d⁻¹ = 1 for a p-adic integer d iff the 0-th digit of d and p are coprime, if p ≠ 0.
57    d * d⁻¹ = 1 for a p-adic integer d iff the digits of d are equal to 1 or -1, if p = 0.
58
59  * A p-adic integer d has an inverse iff the 0-th digit of d and p are coprime, if p ≠ 0.
60    A p-adic integer d has an inverse iff the digits of d are equal to 1 or -1, if p = 0.
61
62  * d * e = 1 for p-adic integers d and e iff the 0-th digit of d and p are coprime and e = d⁻¹,
63    if p ≠ 0.
64    d * e = 1 for p-adic integers d and e iff the digits of d are equal to 1 or -1 and e = d⁻¹,
65    if p = 0.
66  * d * e = 1 for p-adic integers d and e iff the 0-th digit of e and p are coprime and d = e⁻¹,
67    if p ≠ 0.
68    d * e = 1 for p-adic integers d and e iff the digits of e are equal to 1 or -1 and d = e⁻¹,
69    if p = 0.
70
71  * Zs[p] is a domain iff p is a proper prime power.
72
73  * Zs[p] has no zero diviors iff p is a prime power (including the case p = 1).
74  mkRat_eq_divInt
75  * A p-adic integer d is a zero divisor iff
76
77    * there is a q dividing p with q ≠ 1 and q and p / q coprime such that the projection of d to
78    Zs[q] (where Zs[p] =+* Zs[q] × Zs[p / q]) is equal to 0, if 1 < p, or
79
80    * d k = 0 for some k, if p = 0.
81
82    * Since Zs[1] is trivial, it doesn't have any zero divisors (not even 0).
83
84  ## Important definitions
85
86  * `padic_integer p`
87  The type of p-adic integers.
88
89  * `digit_nat n k`, `digit_int a k`, `digit_rat r k`
90  The k-th digit of a natural number n, an integer a, or a rational number r whose denominator is
91  coprime to p, as a natural number (digit_nat) or integer (digit_int and digit_rat) between 0 and
92  p - 1, if p ≠ 0. For p = 0 it is equal to n, a, or the numerator of r if k = 0 and equal to 0
93  otherwise.
94
95  * `of_nat n`, `of_int a`, `of_rat r`
96  The canonical embeddings of ℕ, ℤ, and ℚ (for fractions whose denominator is coprime to p) into
97  Zs[p], if p ≠ 0. For p = 0, the 0-th digit of the resulting p-adic integer is equal to n, a, or the
```

97 Z_[p], if p ≠ 0. For p = 0, the 0-th digit of the resulting p-adic integer is equal to n, a, or the
98 numerator of r, while all other digits are equal to 0.
99
100 * `to_nat d k`
101 The smallest natural number which is congruent to d mod p^(k+1), if p ≠ 0. For p = 0 it is the
102 absolute value of the 0-th digit of d.
103
104 * `add_nat d e k`, `mul_nat d e k`
105 The smallest natural number which is congruent to (d + e) mod p^(k+1) or (d * e) mod p^(k+1), if
106 p ≠ 0. For p = 0 it is the sum or product of the absolute values of the 0-th digits of d and e.
107
108 ## Notation
109
110 * We introduce the notation `Zs[p]` for the p-adic integers.
111
112 * Certain lemmas and theorems require some variable (usually p or n) to satisfy a technical
113 condition like p ≠ 0 or 1 < n. These conditions are indicated at the end of the name of the
114 respective lemma or theorem by a three letter combination like `pnz` (p ≠ 0) or `oln` (1 < n).
115
116 ## Implementation notes
117
118 Unlike Z_[p] in mathlib, this implementation of the p-adic integers does not assume that p is
119 prime or greater than 1.
120

4124 Possibly to do:
4125 https://leanprover.zulipchat.com/#narrow/stream/113488-general/topic/
4126 How.20to.20deal.20with.20rewriting.20in.20types.3F
4127
4128 Yaël Dillies:
4129 "Okay then I would highly suggest you use equivalences of the form
4130 (Π x : α ⊕ β, R x) ≃ (Π a : α, R (Sum.inl a)) × (Π b : β, R (Sum.inr b)).
4131 This is morally equivalent to what you're trying to do, but it's much more idiomatic for
4132 formalisation."

/-!
In this section it is shown that Zs[p] is a domain iff p is a proper prime power, Zs[p] has no
zero divisors iff p is a prime integer (including the case p = 1) and that a p-adic integer d is a
zero divisor iff
* there is a q dividing p with q ≠ 1 and q and p / q coprime such that the projection of d to Zs[q]
(where Zs[p] →+* Zs[q] × Zs[p / q]) is equal to 0, if 1 < p, or
* d k = 0 for some k, if p = 0.
Since Zs[1] is trivial, it doesn't have any zero divisors (not even 0).
-/
/--
The inverse of a p-adic integer d if p ≠ 0 and the 0-th digit of d and p are coprime, and the
pointwise sign (in Zs[0] = ℤ^ℕ) if p = 0.
-/
protected def inv : Zs[p] → Zs[p] :=
ite (p = 0) (λ d k => sign (valMinAbs (d k))) (λ d k => @digit_nat p (↑(to_nat d k))⁻¹ k)
/--
The inverse of a p-adic integer d if p ≠ 0 and the 0-th digit of d and p are coprime, and the
pointwise sign (in Zs[0] = ℤ^ℕ) if p = 0.

Overview
In this file it is shown that the two implementations of the p-adic integers Zs[p] and Z_[p]
(mathlib) are isomorphic (as commutative rings) if p is prime.
